

ATARI® XE™ SYSTEM

Keyboard

Owner's Manual

IMPORTANT INFORMATION

The ATARI XE keyboard uses and produces radio frequency energy. If not installed and used according to the instructions in this manual, the equipment may cause interference with your radio and TV reception.

If you believe that this equipment is causing interference with your radio or TV reception, try switching the equipment off and on. If the interference problem stops when the equipment is switched off, then the equipment is probably causing the interference. You may be able to correct the problem by trying one or more of the following measures:

- Adjust the position of the radio or TV antenna.
- Reposition the equipment in relation to the radio or TV.
- Move the equipment away from the radio or TV.
- Plug the equipment into a different electrical outlet so the equipment and radio or TV are connected to separate branch circuits.

If necessary, consult your Atari dealer or an experienced radio-TV technician for additional suggestions.

A helpful resource is *How to Identify and Resolve Radio-TV Interference Problems*, prepared by the Federal Communications Commission and available from the U.S. Government Printing Office, Washington, DC 20402, Stock No. 004-000-00345-4.

WARNING: This equipment has been certified to comply with the limits for a Class B computing device, pursuant to Subpart J of Part 15 of the FCC rules. These rules are designed to provide reasonable protection from interference when the equipment is used in a residential setting. However, there is no guarantee that interference will not occur in a particular home or residence. Only those computing devices that are certified to comply with the Class B limits may be attached to this equipment. Operation of non-certified devices with this equipment is likely to result in interference with radio and TV reception. Shielded cables should be used on all I/O connectors (except the joystick and mouse connectors); otherwise, radio emissions may exceed Class B limits.

Every effort has been made to ensure the accuracy of the product documentation in this manual. However, because Atari Corporation is constantly improving and updating its computer hardware and software, it is unable to guarantee the accuracy of printed material after the date of publication and disclaims liability for changes, errors, or omissions. Reproduction of all or any portion of this manual is not allowed without the written consent of Atari Corporation.

INTRODUCTION

Meet the ATARI XE Keyboard

The ATARI®XE™ keyboard turns your XE into a full-fledged computer system!

With the keyboard attached to the console, you can use ATARI BASIC™, the XE's built-in programming language, to create your own programs. And if you're a serious game player, adding the keyboard gives you the option of playing the most sophisticated computer games requiring keyboard interaction.

Along with other add-ons such as a disk drive or program recorder, the keyboard lets you use game and applications programs available on disk and cassette. Now you can take advantage of word processors, database programs, and much, much more—all with your XE system.

Using This Manual

It's easy to operate the XE keyboard and use ATARI BASIC, and you'll get the best results if you work with the keyboard and BASIC correctly from the start. This manual explains how to do that in clear, non-technical language that computer novices as well as seasoned experts can understand.

The chapters in this manual are designed to be read in sequence. You begin by connecting the keyboard and go on to learn about the keyboard's features. The remaining chapters offer tutorials on ATARI BASIC for the first-time BASIC programmer.

Chapter 1: Getting Started explains how to connect the XE keyboard to the console and turn on the system. You'll also learn how to use the keyboard to display special graphics and international language characters.

Chapter 2: Editing BASIC Programs with the ATARI XE Keyboard explains how to use the keyboard to enter and edit ATARI BASIC programs.

Chapter 3: Writing a Simple BASIC Program shows you step-by-step how to create your first BASIC program.

Chapter 4: Creating an Interactive BASIC Loop explains how to use BASIC commands to automatically repeat a segment of a program.

Chapter 5: Processing Random Numbers and Mathematical Functions with BASIC explains how to do math calculations within a BASIC program.

Chapter 6: Making Decisions and Solving Problems with BASIC explains how to write programs that mimic the way humans approach a decision or problem.

Chapter 7: Producing Sound and Graphics with BASIC explains how to jazz up your BASIC programs with colorful graphics, music, and other sounds.

Appendix A: Sample BASIC Programs offers a sampling of BASIC programs for you to try.

Appendix B: BASIC Reserved Words is a list of BASIC commands and descriptions of their functions.

Appendix C: ATASCII Character Set is a list of all character sets available with the XE keyboard.

Appendix D: Error Messages is a list of BASIC error codes and their meanings.

Index helps you locate terms and procedures explained in the manual.

Customer Support tells you where to find more information about your Atari computer products.

Paragraphs marked **Note** or **Warning** appear throughout the manual. Notes contain useful hints and other information relevant to the topic being discussed. Warnings alert you to potential problems and suggest ways to avoid them.

Note: In this manual, characters enclosed by square brackets ([]) represent keys. Sometimes a procedure requires you to use two keys at the same time. In that case, the keys are listed in order. For example, [Option] [Select] means to press and hold down the [Option] key and press the [Select] key to perform a function.

CHAPTER 1

GETTING STARTED

Connecting the XE Keyboard

With a keyboard connected to your XE game system, you can use the XE's built-in programming language, ATARI BASIC, as well as play Missile Command™ and other games that use keyboard control.

Before you connect the XE keyboard, set up your XE game system as described in the **ATARI XE Game System Owner's Manual**. Make sure the XE console is turned off (the indicator light on the [Power] key will be off). Then plug the XE keyboard cable into the keyboard port on the left side of the console.

The back of the keyboard has wide hooks for connecting it to the console. To connect the two units, tip up the front of the keyboard and engage the hooks into the slots under the front edge of the console.

Turning On Your XE Game System and Keyboard

Once you've connected a keyboard, you can use either of the XE's two built-in programs, ATARI BASIC or Missile Command. To run BASIC, simply turn on your console (press the [Power] key). With the keyboard connected, the XE loads BASIC instead of Missile Command and displays it on screen.

To load Missile Command, hold down the [Select] key when you turn on the console. The Missile Command title screen will appear.

Turning On a System with a Disk Drive

Connecting an Atari disk drive to the XE lets you use disk-based games and applications. You can also start up your system with a disk program instead of Missile Command or BASIC.

To start up your system with a disk program when a disk drive is attached, follow these steps:

1. Turn on your video display and disk drive.
2. When the drive's busy light goes off, insert the program disk you're going to use into the drive and close the latch.
3. Turn on power to the console. If the program runs with BASIC, simply press **[Power]**. If the program runs without BASIC, hold down **[Option]** and press **[Power]**.

The disk-based program will load, ready for you to start working.

Running Cassette Programs

Connecting an Atari program recorder to the XE lets you use programs supplied on cassette tapes. To run a cassette program, follow these steps:

1. Connect a program recorder to your XE system by plugging its cable into the SIO port on the back of the console. Be sure your keyboard is also connected.
2. With all system components turned off, insert the program cassette into the program recorder.
3. Turn on your video display and any other peripherals.
4. If the program must be loaded from BASIC, press **[Power]** to turn on your console. When the BASIC ready prompt appears, type CLOAD and press **[Return]** on the keyboard.

If the program does not require BASIC to run, hold down **[Start]**, then press **[Power]** to turn on your console.

5. After you hear a beep, press the **[Play]** key on the recorder, then press the **[Return]** key on the keyboard. The program will load.
6. If the program is a BASIC program, the ready prompt will reappear. Type RUN to run the program.

Understanding Your Keyboard

The XE keyboard is like having three keyboards in one. It works like a conventional typewriter keyboard but can also be used to display graphics or international language characters.

Like a conventional typewriter keyboard, the letter, number, punctuation, [Shift], [Tab], [Caps], and [Space Bar] keys all work just as they do on a typewriter.

As a graphics character keyboard, you can display decorative characters on screen.

As an international character keyboard, you can display characters used in foreign languages.

In addition, the XE keyboard has a number of special keys for controlling the XE and the programs you run on it. Though the function of each key varies from program to program, the following sections describe how these keys are used in ATARI BASIC and, where applicable, how they are typically used in other programs. Refer to the manual that comes with each program you use for information on program-specific key functions.

Some of these keys are used together (pressed simultaneously) to add extra functions without increasing the size of the keyboard.

Refer to **Chapter 2, Editing BASIC Programs with the ATARI XE Keyboard**, on using the special keys to edit ATARI BASIC programs.

Note: Most keys on the XE keyboard automatically repeat when held down for more than half a second.

[Help]

Sometimes used to display instructions about the currently loaded program.

[Esc]

Often used to move from one menu to another within a program.

[Delete Bk Sp]

In most programs, including ATARI BASIC, deletes the character to the left of the cursor and moves the cursor one space to the left. Does not close up the space left by the deletion.

[Break]

Usually interrupts the current computer activity.

[Return]

Tells the computer that you are done typing or editing a line of text or program response.

[Caps]

Shifts between upper- and lowercase letters.

Sometimes used with the **[Shift]** key to change keyboard modes.

In ATARI BASIC, exits from the graphics character keyboard mode.

The Inverse Video Key

Turns the inverse video screen display on and off. Inverse video reverses the colors (or black and white) used on a screen display.

[Control]

Always used with another key to perform a special function. In ATARI BASIC, prints graphics characters when used with the alphabet keys.

[Control] [1]

Often used in programming languages to stop and restart a scrolling screen display.

[Control] [2]

Sounds the XE's buzzer. Your monitor or TV speaker must be turned up for the speaker to be heard.

[Control] [3]

Produces an end-of-file (EOF) response to a program that is reading input from the keyboard (used by advanced programmers).

[Control] [Insert]

Inserts a space between characters in many programs including ATARI BASIC.

[Control] [Delete Bk Sp]

Deletes the character under the cursor and shifts the remaining characters on the line to close up the empty space.

[Control] [G]**[Control] [O]****[Control] [E]****[Control] [S]**

Moves the cursor up, down, left, and right.

[Control] [Caps]

Locks the computer into Control mode. This is handy when you need to press a series of keys used in conjunction with the [Control] key.

[Shift]

Used in conjunction with letter keys to type uppercase letters.

[Shift] [Insert]

Inserts a blank line in ATARI BASIC programs.

[Shift] [Delete Bk Sp]

Deletes a line from an ATARI BASIC program.

[Shift] [Caps]

Locks the computer into uppercase mode for letter characters.

Adding ATARI Graphics

The ATARI XE keyboard has 29 built-in graphics characters. You can let your imagination run wild with these and create works of art, eye-catching signs, borders around text, or other graphic creations. To display the graphics characters on your screen, press **[Control]** and any of the keys shown below. (The keys in the illustration show the graphics characters on the front of the keycaps.) If you intend to use several characters, it may be more convenient to lock in the Control mode by pressing **[Control]** and **[Caps]**. Press **[Caps]** to exit from the Control Lock mode and return to standard keyboard characters.

Adding an International Character Set

When you type pages in a foreign language, you usually have to go back and laboriously add accent marks, cedillas, and other diacritical marks by hand. The ATARI XE makes typing foreign language documents easy because it supplies these marks for you.

International characters are available when you use ATARI BASIC. The keyboard diagram on the following page shows the international characters that are associated with the letter keys. To activate the international characters, type the statement below and press **[Return]**.

POKE 756,204

Pressing [Control] and any of the keys shown below will produce an international character instead of a graphics character. To return to the graphics character mode and normal keyboard utilities, type the following line and press [Return]:

POKE 756,224

CHAPTER 2

EDITING BASIC PROGRAMS WITH THE ATARI XE KEYBOARD

No matter how well you type on a typewriter, you will need to familiarize yourself with the special features of the ATARI XE keyboard before you begin editing with ATARI BASIC.

Auto Repeat Function

Begin by typing the letter A:

A

Continue to hold down the [A] key and watch the rows of A's appear. When a line is filled, the cursor automatically drops down to the next row. There is no need to press [Return].

```
AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA
AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA
AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA
```

You are using the built-in auto repeat function of the ATARI XE keyboard. Most of the keys, including the [Space Bar], have auto repeat. Did you hear a buzzer when the A's almost filled the third line? That warning buzzer—a built-in function of ATARI BASIC—indicates that the instruction line is getting too long. An instruction line can be no more than three lines long.

Error Messages

Find the [Return] key and press it. You should see the word ERROR on the screen, followed by the three lines of A's that you typed. Your computer is interacting with you now. It is telling you that it doesn't understand what you are typing because the rows of A's aren't part of the BASIC language. Clear your screen by pressing [Return] until the Error message no longer appears. To avoid getting Error messages while you are following the directions for editing, do not press [Return] until you are instructed to do so.

Uppercase and Lowercase

To make lowercase A's, press [Caps] once and hold down [A]. You should see this:

aaaaaaaa

To return to uppercase letters, press [Caps] and type more A's. You should see this:

AAAAAAA

Try typing a word beginning with A, such as ATARI. Type in the following words, switching between upper- and lowercase letters with the [Caps] key:

ATARI XE atari xe

Unlike a typewriter, the computer has separate keys to control capitalizing and shifting. In both the lowercase and the uppercase modes, the symbol that appears is always the one shown on the bottom of a key. To get the symbol on the top half of a key, use the [Shift] key. There are two [Shift] keys on the keyboard. You can use either one.

Using [Caps], [Shift], and [1], try typing this:

!!!ATARI XE!!! !!!atari xe!!!

Experiment with different words, letters, and punctuation marks.

Graphic Symbols

Many of the keys have two or three symbols on them. Each letter key has a letter on the top side and a graphic symbol on the front side. Some of the other keys have three symbols or words, all on the top side. One function of a key is activated by pressing the key only, another by pressing [Shift] and the key, and the third by pressing [Control] and the key. Graphic symbols are produced by pressing [Control] and the key.

To type a graphic symbol (the symbol on the front side of a letter key), use the [Control] key on the left side of the keyboard. First press [Control]. While you are still holding down [Control], press a graphic symbol key. Then release both keys.

Hold down **[Control]** and try typing ATARI. You should see this:

Only five characters appear on the screen. If you use the **[Control]** key when you press a number key, no graphic symbols appear.

Graphic symbols are most useful in making screen designs, borders, and simple artwork. You can lock the keyboard into graphic symbols by holding down **[Control]** and then pressing **[Caps]**. Pressing **[Caps]** just once will put you back into the lowercase mode.

Cursor Control

The **[Control]** key is used most frequently for directing the movement of the cursor. The cursor is the small white square that marks your place on the screen. Find the **[Up Arrow]** key next to letter P. The arrow, like the **[Control]** key, is outlined in white. This white marking indicates that the arrow function is activated only by using the **[Control]** key. Press **[Control]** and then **[Up Arrow]** and watch the cursor move to the top of the screen. When it reaches the top, the cursor returns to the bottom of the screen and starts moving up again. Now try out the **[Down Arrow]**, **[Right Arrow]**, and **[Left Arrow]** keys. Remember to use the **[Control]** key.

Clearing the Screen

The **[Control]** key is frequently used in conjunction with the **[Clear]** key to erase everything on the screen. Press and hold **[Control]**, then press **[Clear]**. This action should clear your screen and return the cursor to the upper left corner of the screen. Try it again.

Now fill up the screen with more letters, numbers, words, and graphic symbols. This time use **[Shift]** with **[Clear]** to clear the screen. Both **[Shift] [Clear]** and **[Control] [Clear]** empty the screen and return the cursor to the upper left corner.

Inserting

The **[Control]** key is used with the **[Insert]** key to insert spaces in a line. To practice this function, type:

!!!ATARI XE!!!

Position the cursor on top of the first letter A in ATARI. Holding down **[Control]**, press **[Insert]** 11 times. You should see this:

!!! ATARI XE!!!

Eleven blank spaces have been added in the middle of the line. This function is very useful for inserting words. Using the cursor control keys (the arrows), return to the space next to the third exclamation mark on the line. Press **[Space Bar]** once and type THIS IS AN in the blank spaces as shown below:

!!!THIS IS AN ATARI XE!!!

To add blank lines, rather than individual blank spaces, hold down **[Shift]**, then press **[Insert]**. A whole new blank line will appear on the screen. Insert a few more blank lines, but don't insert so many that you have a blank screen. Keep the sentence on the screen so that you can proceed to the next exercise.

Deleting

Using the **[Control]** key with the **[Delete Bk Sp]** key makes deleting just as easy as inserting. Position the cursor on the T in the word THIS. Holding down **[Control]**, press **[Delete Bk Sp]** 11 times. Your screen should look like this:

!!!ATARI XE!!!

You now know how the **[Control]** and **[Delete Bk Sp]** keys work. To discover what the **[Delete Bk Sp]** key does when pressed by itself, position the cursor on the first A and press **[Delete Bk Sp]** three times. Your screen should look like this:

ATARI XE!!!

When used alone, the **[Delete Bk Sp]** key moves the cursor to the left, erasing as it goes, but it does not close up the space. Using the **[Control]** key with the **[Delete Bk Sp]** key erases the characters to the right and closes up the gap.

The third function of the **[Delete Bk Sp]** key requires the use of the **[Shift]** key. Pressing and holding **[Shift]** and then pressing **[Delete Bk Sp]** deletes an entire line and returns the cursor to the left margin. It does not matter where the cursor is positioned on the line when you press **[Shift] [Delete Bk Sp]**; the entire line is erased from the screen.

Tabs

On a blank screen move the cursor to the left margin and type an asterisk. Press **[Tab]**. Every time the cursor stops, type an asterisk. You should have six asterisks spaced across the screen as shown below:

* * * * * *

Press **[Tab]** only and notice that it stops at the same preset tab marks every time. The first preset tab is five spaces from the left margin (a normal paragraph indentation), and the following tabs are eight spaces apart. Position the cursor on top of the first asterisk and move it in three spaces. Press and hold **[Shift]** and then press **[Tab]** to activate the **[Set Tab]** function. Move the cursor back to the left margin, then press **[Tab]**. The cursor jumps to the newly set tab position.

Continue to press **[Tab]**. It continues to go to all the preset tab positions, in addition to the new one. When the cursor jumps down to the next line, it ignores the new tab position. (But on all the following lines the cursor will go to all the tab positions—the new one and the preset ones.) Return the cursor to the first asterisk and press **[Tab]**. The new tab mark is still there.

Return the cursor to the left margin. Press **[Tab]** to move it to the first tab mark (three spaces in). Use **[Control]** with **[Tab]** to activate the **[Clr Tab]** function. Press **[Tab]** to get to the next tab position and clear that one also. Move the cursor back to the left margin of the same line and press **[Tab]** only. The cursor should skip two tab positions. Continue pressing **[Tab]** until the cursor drops to the next line. **[Clr Tab]** did not clear the second tab position on this line. (However, both tab positions have been cleared from all the following lines.)

Inverse Video

Type the word ATARI. Find the [Inverse Video] key  and press it just once. Type ATARI again. Press [Inverse Video] again and type ATARI again. Your screen should look like this:

ATARI **ATARI** ATARI

Inverse video creates blue letters on a white background, the inverse of the normal screen colors. This function is very useful for highlighting letters in your programs. Just one touch of the [Inverse Video] key changes the way letters are displayed.

Miscellaneous Keys

Another important key is the Escape key [Esc]. When you press it once, nothing happens. When you press it twice or more, this graphic appears on the screen . Press [Return] and try again. In later sections you will need to use the [Esc] key.

The [Break] key is in the upper right corner. When you press this key, the cursor drops one line and moves to the left margin. In **Chapter 7, Producing Sound and Graphics with BASIC**, you will learn how to use the [Break] key.

When you press the [Help], [Start], [Select], and [Option] keys, nothing happens. These keys are programmable and often have functions in software programs.

After you press the [Reset] key, the screen will turn blank for a second or two, and the Ready prompt will appear. The [Reset] key restarts the system. You should use this key very sparingly because, in many programs, the information that you are entering or have entered will be lost.

CHAPTER 3

WRITING A SIMPLE BASIC PROGRAM

□ □ □ □ □ □ □ □ □ □ □ □ □ □ □ □

Once you know your way around the computer keyboard, it's easy to write your first program. To begin, clear the screen and make sure the cursor is on the left margin.

NEW: Clearing the Computer's Memory

Type in the word NEW, then press [Return]:

NEW

NEW tells the computer to get ready for a new set of instructions by erasing any old instructions that might be in the computer's memory.

LIST: Checking the Computer's Memory

To make sure nothing is in the computer's memory, ask the computer to list any instructions that it might be storing. Type LIST on a line by itself and press [Return]:

LIST

If you typed NEW correctly, nothing other than the Ready prompt appears on your screen. Now you can begin a new program. Type in the first line of instruction to the computer. Type in the line exactly as it appears below and press [Return] after the last quotation mark:

10 PRINT "I HEARD OF A POET NAMED SAM"

All instruction lines in BASIC programs are numbered. When you type this one-line program, make sure that the 1 and the 0 in the number 10 are numerals, not letters. If you used letters instead of numbers, you will get an Error message.

A numbered instruction line in a program can be longer than one line on the screen. When the cursor runs out of space on one line, it automatically drops down to the next line. You should press [Return] only at the end of an instruction line to tell the computer that you are done typing the instruction and that it should store the instruction in its memory. Nothing dramatic happens when you press [Return]; the cursor merely returns to the left margin so that you can begin another line in the program.

RUN: Executing Instructions

To make the computer execute your program, you have to type RUN. The RUN command tells the computer to carry out its instructions. Type RUN and press [Return] to see what happens:

```
RUN  
I HEARD OF A POET NAMED SAM
```

The computer's first and only instruction, line 10, was to print the words inside the quotation marks. Clear the screen, type RUN again, and press [Return]. The computer follows its instruction again and prints:

```
I HEARD OF A POET NAMED SAM
```

Even though the instruction is no longer on the screen, the computer remembers what to do. Your program is stored in RAM (Random Access Memory), the programmable section of the computer's memory. When you type LIST, the computer shows on the screen all the instructions stored in the RAM portion of its memory. Type LIST. Your screen should look like this:

```
LIST  
10 PRINT "I HEARD OF A POET NAMED SAM"
```

If your screen looks different, you might have forgotten to press [Return] at the end of each entry or to type LIST on a line by itself. Type in the line below, then give the RUN command:

```
20 PRINT "I MET HIM ONE DAY, AND TO MY DISMAY,"  
RUN
```

The words enclosed in the quotation marks in both lines of the program appear on the screen. Type LIST to see the instructions that the computer has stored in RAM. Both lines 10 and 20 appear.

LINE NUMBERING: Creating Order

Each instruction line in a BASIC program must have a number in front of it. The numbers are called "line numbers." The computer executes the instructions, beginning with the smallest number and continuing through the program until all the instructions have been carried out. The usual procedure is to number lines by tens so that enough numbers are available for inserting additional lines later, if desired. Try inserting a line now. Add line 15 (to the following example) and instruct the computer to run the program. Your screen should look like the following program:

```
15 PRINT "WHOSE POEMS WERE THE TALK OF THE LAND."  
RUN  
10 PRINT "I HEARD OF A POET NAMED SAM  
    WHOSE POEMS WERE THE TALK OF THE LAND.  
    I MET HIM ONE DAY, AND TO MY DISMAY,
```

The computer automatically inserted line 15 between lines 10 and 20. Write another line:

```
30 PRINT "HIS BRAINS WERE SILICON-SAND."  
RUN  
LIST
```

The RUN and LIST commands cause all four lines of PRINT instructions to appear on the screen.

ERROR MESSAGE: Computer Talk for "I Don't Understand"

PRINT simply tells the computer to print whatever is inside quotation marks on the screen. The computer doesn't care what words or symbols are inside the quotation marks; the words don't need to be spelled correctly or make sense. Try out the instructions below:

```
40 PRINT "AYE SAY HYE; U SAY BI."  
RUN
```

Even when the quotation marks enclose a nonsense sentence containing misspelled words, the computer does what it is told to do. However, try misspelling PRINT as shown below and see what happens:

```
50 PRIMT "I SAY HI; YOU SAY BYE."
```

The computer sends you an Error message. The computer verifies only those instructions that are outside the quotation marks because those instructions are intended for the computer. Instructions that are inside the quotation marks are intended for you, so the computer copies them exactly. Move to a blank line but do not clear the screen. Run the program to see what happens.

Error message 17 appears at line 50, the line in which you intentionally misspelled PRINT. Error message 17 is called the "syntax error." It indicates that the instructions were indecipherable to the computer. (For a complete listing of Error messages, see **Appendix D**.)

There are several ways to correct an Error message. The easiest solution is to move the cursor to the line that contains the typing error. Place the cursor on the offending M in PRIMT and change it to N. Press **[Return]**. (In this case, you can press **[Return]** regardless of the cursor's position on the line, even if it is in the middle of the word PRINT.) No new Error message appears this time. Clear the screen and run the program. The screen should not show any Error messages.

Another way to correct an Error message is to erase the offending line. To practice this technique, type another line that has an intentional error. This time omit the quotation marks in the PRINT statement below, then run and list the program:

```
60 PRINT I ONCE HAD A PROGRAM CALLED BOZON
RUN
LIST
```

An Error message appears when you press **[Return]** and when you try to run and list the program. To erase the offending line, simply type the line number and press **[Return]**:

```
60
RUN
LIST
```

Now the program runs and lists without errors, although line 60 does not contain any instructions. The line I ONCE HAD A PROGRAM CALLED BOZON has been erased. Typing the line number and pressing **[Return]** erases a line entirely from the computer's memory. Type the line correctly as shown below:

```
60 PRINT "I ONCE HAD A PROGRAM CALLED BOZON"
RUN
```

PRINT: Creating Blank Lines

Inserting a blank line after the poem would make the poem more readable. Type in the following instructions to create a blank line between lines 30 and 40:

```
35 PRINT  
RUN  
LIST
```

When nothing follows the PRINT command, the computer creates a blank line. Insert another blank line between lines 50 and 60. Use 55 for the line number and type only the word PRINT after it.

?: Abbreviation for PRINT

You can save time and effort by substituting a question mark (?) for PRINT. Try the next program line below:

```
70 ? "THAT RAN FROM DUSK UNTIL DAWN."  
RUN  
LIST
```

The program runs the same with ? as with PRINT. The question mark is just a convenient shortcut. For clarity, all the following PRINT statements in this tutorial use the word PRINT, but you can substitute a question mark.

Logical Line Length

Sometimes the quotation marks contain too many characters to fit on one or two lines. Make sure the sound is audible on your television or monitor before you type the following sample:

```
80 PRINT "IT WOULDN'T RESPOND TO ESCAPE, BREAK, CONTROL,  
OR LIST, AND IT WAS STILL RUNNING WHEN I TURNED OFF THE  
SWITCH."
```

When the cursor reaches the third line, a buzzer sounds. The buzzer indicates when you are approaching the maximum length of an instruction line. An instruction line can be no longer than three screen lines. This limit is called a "logical line." (You may wish to turn down the volume now.)

Screen Display

Words are often broken in awkward places when the cursor reaches the end of a line on the screen. Also, the spacing between words when you type in the program lines is different from the word spacing when the computer runs out the program. To avoid both of these problems, determine what you want each line to look like and type separate PRINT statements for each line. Retype the sentence in line 80 so that it appears in a poem format:

```
80 PRINT "IT WOULDN'T RESPOND"  
90 PRINT "TO ESCAPE, BREAK, CONTROL, OR LIST,"  
100 PRINT "AND IT WAS STILL RUNNING"  
110 PRINT "WHEN I TURNED OFF THE SWITCH."  
RUN  
LIST
```

Printing Graphic Symbols

You can also use graphic symbols in PRINT statements to produce simple artwork. To set off the poem, type the lines below. Use [Control] [J] and [Control] [H] to create the graphics:

```
58 PRINT "  ▲ "  
115 PRINT "  ▼ "
```

Print "␣": Clearing the Screen

You can make your program look even better by making sure the screen is clear when you start. Type a line number, PRINT, and the first quotation mark. Press [Esc] once lightly. Then press either [Shift] and [Clear] or [Control] and [Clear]. A bent arrow appears on the screen. Type another quotation mark and press [Return]. Then run and list the program:

```
5 PRINT " ␣ "  
RUN  
LIST
```

[Control] [1]: Stopping the Screen Display

Now the program looks better, but it is too long for all the lines to appear together on the screen. When the computer lists the program, you can stop the lines as they move up and off the screen by pressing the [Control] and [1]. Type, LIST. Use two fingers on your left hand to press [Control] and [1] and one finger on your right hand to press [Return]. [Control] [1] both starts and stops the LIST function.

CHAPTER 4

CREATING AN INTERACTIVE BASIC LOOP

□ □ □ □ □ □ □ □ □ □ □ □ □ □ □ □

Loops tell the computer to go back and repeat instructions in the program automatically. The GOTO command saves you the trouble of typing the same instruction lines over and over again. The DIM and INPUT commands allow you to interact with your computer on a question-and-answer basis. Putting these three commands together—GOTO, DIM, INPUT—lets you have an ongoing conversation with your computer.

GOTO: A Computer's Map

The simplest computer loop is the GOTO loop. GOTO is always followed by a line number that tells the computer where to go on the next command. You need just two commands to create a loop. Type in the program below to produce an infinite loop:

```
NEW
110 PRINT "CONGRATULATIONS!"
120 GOTO 110
RUN
```

To break this infinite loop, turn off the computer or use the [Break] key. When you stop the loop with the [Break] key, one of the following messages appears:

STOPPED AT LINE 110

or

STOPPED AT LINE 120

The computer is telling you where it was when it received the command to stop.

Comma: A Tab Marker

The GOTO loop puts out an endless amount of work with just two lines of instruction. To make the program fancier, list your program, position the cursor in the space next to the last quotation mark, insert a comma, and press [Return]. Run the program and watch the special effects:

```
LIST
110 PRINT "CONGRATULATIONS!",
120 GOTO 110
RUN
```

The comma acts like a tab. Each time the computer moves down to the next line and prints CONGRATULATIONS!, it moves to the next tab position. The result is a barber-pole effect. Remember to break the loop with the [Break] key.

Semicolon: Computer Glue

A semicolon produces another kind of effect. List the program, change the comma in line 110 to a semicolon, press [Return], and run the program:

```
LIST
110 PRINT "CONGRATULATIONS!";
120 GOTO 110
RUN
```

The semicolon glues the PRINT statements together with no space in between. To put some space between the words, go back and edit line 110 so that it looks like this:

```
110 PRINT "CONGRATULATIONS! ";
RUN
```

Colon: A Separator

The colon is a separator. It permits two instructions to be placed on one line. Change the semicolon in line 110 to a colon and add the PRINT statement below:

```
110 PRINT "CONGRATULATIONS!": PRINT "YOU JUST WON THE
LOTTERY."
RUN
```

As you progress in your programming ability, conserving space in the computer's memory becomes important. Consolidating commands on one line with a colon is one way to help save free bytes of RAM memory. (A byte is one character of information.) To see how much memory is conserved, type the following statement:

```
PRINT FRE (0)
```

The computer will answer with a number. Reprogram line 110 so that the two PRINT statements take up two program lines:

```
110 PRINT "CONGRATULATIONS!"
115 PRINT "YOU JUST WON THE LOTTERY."
PRINT FRE (0)
```

Compare the two numbers of free bytes available. The second number is two or three less than the first. Because simplicity is more important to a beginning programmer than conservation of computer memory, the program lines in this section will usually contain only one statement per line. One exception will be a PRINT statement that inserts a blank line between segments of the program. Type in the new line below to see the effect:

```
110 PRINT:PRINT "CONGRATULATIONS!"  
RUN
```

DIM and INPUT: Dimensioning and Inputting String Variables

The XE must be programmed to respond to a question. You can use a PRINT command to ask a question and an INPUT command to enter a response into the computer. However, when you give the computer an answer, the computer must know where to put it. It places it in a spot called a "variable" in RAM memory. If the answer is composed of letters, numbers, or both, it is called a "string variable." Your ATARI XE needs to know how much space you will need for an answer so that it can reserve space for it. This process is called "dimensioning the string variable."

The DIM (dimensioning) command always accompanies the INPUT command for string variables because DIM determines the expected size of the answers. For variables, the size refers to the number of characters, including blanks, that are needed. You have to tell the computer the maximum number of spaces that the answer can occupy.

Change the loop program to a program that asks a question and expects an answer. There is no need to rewrite the program; just write in the new lines—lines 10, 120, 130, and 140—as shown below. (Typing in the new line 120 automatically erases the old line 120.)

```
10 DIM ANSWERS (100)  
110 PRINT: PRINT "CONGRATULATIONS!"  
115 PRINT "YOU JUST WON THE LOTTERY."  
120 PRINT:PRINT "HOW DOES THAT MAKE YOU FEEL?"  
130 INPUT ANSWERS  
140 PRINT "I THOUGHT YOU WOULD SAY THAT."  
RUN
```

Line 10 tells the computer to save enough space in its memory for an answer that is a maximum of 100 characters. The variable in this program has been named ANSWER. The variable is going to store letters and numbers, so it is a string variable. String variables are designated by a dollar sign after the last letter of the variable name.

Line 130 allows you to enter an answer. When you run the program, the computer displays the question on the screen, and you then type in your answer. That answer is stored in the string variable called ANSWER\$. If the DIM statement, line 10, was omitted, an Error message would occur, and the INPUT statement wouldn't work.

?: Courtesy of INPUT

Run the program again. Two question marks will appear on the screen. The second question mark will be on the line next to the left margin. List your program and notice that you typed only one question mark in the program. The INPUT command always puts a question mark on the screen for you. Type the variation of line 120 below:

```
120 PRINT "HOW DOES THAT MAKE YOU FEEL";
```

Run the program and type in your response when the computer asks its question. Now only one question mark appears, and your answer immediately follows the question on the same line. Create some more dialogue by dimensioning more string variables and inserting more INPUT statements. The DIM statements should be at the beginning of the program:

```
20 DIM DATES$ (25)  
140 PRINT:PRINT "WHEN WOULD YOU LIKE TO COME AND PICK UP  
YOUR PRIZE";  
150 INPUT DATES  
RUN
```

String Variables in PRINT Statements

The computer program now asks two questions but doesn't respond to your last answer. To get a response, you can place the string variable in the PRINT statement in the following way:

```
160 PRINT "I'M SORRY, BUT OUR OFFICES ARE ALWAYS CLOSED  
ON ";DATES$;". TOO BAD!"
```

The semicolon glues the string variable between two phrases in quotation marks. Run the program. If the words are not spaced correctly, compare your line to the line above. You probably left out a space after the N of ON or forgot the period and the space before TOO BAD!. Those spaces are important. Practice with another string variable input:

```
30 DIM NAMES (1)
170 PRINT "BY THE WAY, WHAT IS YOUR NAME";
180 INPUT NAMES
190 PRINT "WELL, "; NAMES; ", I BET YOU WOULD LIKE TO KNOW
HOW MUCH YOU WON. FIRST YOU HAVE TO ANSWER A QUESTION."
```

Run the program. Even though you typed in a full name, the computer printed only the first initial. That happened because the area dimensioned in RAM memory for the name was too small. Most people's names are longer than one character. Change line 30 to a more reasonable number of spaces and run the program:

```
30 DIM NAMES (25)
RUN
```

Inputting Numeric Variables

So far you have been working with alphanumeric string variables—variables composed of letters, numbers, or both. For instance, the computer would accept the name R2-D2 or 007 as a string variable. However, the number name would be used only as a name, not as a number in any math problems. Now try some numeric variables that can be used in mathematical calculations. Numeric variables do not need a DIM command or a dollar sign. Enter the following program lines:

```
200 PRINT:PRINT "HOW OLD ARE YOU";
210 INPUT AGE
220 PRIZE=AGE*1000
230 PRINT:PRINT "YOU HAVE JUST WON $"; PRIZE;" FROM THE
LOTTERY. YOU CAN COLLECT DURING OFFICE HOURS."
```

In this program, the age that you enter is stored in the numeric variable called AGE. Line 220 creates another variable called PRIZE. Line 220 allows the computer's built-in calculator to calculate the prize money, which is \$1000 multiplied by the age of the winner. (To the computer, * means multiply.) The program does the math calculation for you and stores the answer in PRIZE. Line 230, which places the numeric value inside the PRINT statement in the same manner as string variables, tells you what the answer is.

Input Loops

To repeat your conversation with the computer, add a loop command to the program again. A GOTO statement at the end will make the computer repeat the program from the beginning. For program readability, use an REM statement to show where the main conversation portion of the program begins. A REM (remark) statement functions like a label for the programmer. The computer does not carry out REM commands but only prints them when you list your program.

```
100 REM *** CONVERSATION LOOP ***  
240 GOTO 100
```

The computer must return to line 100, rather than line 10, because it cannot go back over the DIM statements for string variables. If it loops over the same DIM statements, you will receive an Error message.

CHAPTER 5

PROCESSING RANDOM NUMBERS AND MATHEMATICAL FUNCTIONS WITH BASIC

□ □ □ □ □ □ □ □ □ □ □ □ □ □ □ □ □ □

Initially computers were developed to process numbers quickly and easily. To take advantage of the computer's ability to calculate a math answer in a few milliseconds, you must know how to speak to a computer.

Numbers

Type **NEW** to erase the previous statement; then type the statement below and press **[Return]**:

PRINT 10

The computer should print the number 10. Make sure you use the numerals 1 and 0, not letters. Practice printing the following numbers:

PRINT 1000000000

PRINT -1000000000

Use the minus sign (-) on the **[Up Arrow]** key to indicate negative numbers. Do not use commas in numbers. Type the statements below to see what happens when commas are used:

PRINT 9,876,543,210

PRINT 9, 876, 543, 210

In both examples, the computer interprets the commas as separators in a series of numbers. It spaces the numbers out across the screen according to its preset tab positions. To the computer, the 9 is not 9 billion, just the number 9 followed by a series of other numbers.

Scientific Notation

The computer may not understand commas when it prints numbers, but it does understand exponents. Often it will automatically translate a large number into an exponential form. Try the numbers below:

```
PRINT 99999999999
PRINT 55555555555
PRINT 111111111111
PRINT -11111111111
PRINT -98765432112
```

These numbers are large or small enough that the computer prefers to rewrite them in scientific notation. Familiarity with scientific notation is not essential for understanding the computer, or even this chapter.

Scientific notation expresses a large number as a number between 0 and 10 multiplied by a power of 10. An exponent specifies the power of 10. In the following example, $E + 13$ means that the exponent is 13:

$$2.5E +13 = 2.5 \times 10^{13} = 25000000000000$$

You can use exponents to talk to your computer. The caret on the [Right Arrow] key is the symbol for exponents. You must use the [Shift] key to print the caret. Try the following computations:

```
PRINT 2 ^ 1
PRINT 2 ^ 2
PRINT 2 ^ 3
PRINT 2 ^ 4
PRINT 2 ^ 64
```

The first notation is 2 to the first power; the second, 2 to the second power; and so on. The last notation is 2 to the sixty-fourth power, which is a large enough number that the computer needs to express it in scientific notation.

Unless you are a physicist timing electrons in their orbits or an astronomer calculating the size of the universe, you will rarely need to use scientific notation. But if you ever do, the computer is capable of doing your calculations with even these often unwieldy numbers.

The Computer as a Calculator

The computer can perform the same functions as a calculator. Use the plus sign (+) on the [Left Arrow] key to type the statement below:

PRINT 1+1

When you press [Return], the computer immediately gives you an answer, just like a calculator. Invent your own addition problems now. Make the numbers big or small, and try a long series of numbers to add up. Experiment with lots of variations.

Use the minus sign (-) on the [Up Arrow] key for subtraction problems. Try the three versions of the same problem below:

PRINT 4 - 1

PRINT 4-1

PRINT4-1

The same answer appears for each example as soon as you press [Return]. The spacing in math problems is unimportant to the computer. Try out problems of your own. Make long problems that combine subtraction and addition functions.

The multiplication sign—the asterisk (*)—is located on the [Right Arrow] key. The division sign is the slash (/) on the [?] key. Type the following statements:

PRINT 2 * 2

PRINT (2*2)

PRINT 6 / 3

PRINT (6/3)

The computer not only understands the use of parentheses in math problems but needs them when the problems become complex. Notice what happens in this problem with and without parentheses:

PRINT 3* (2+2)

PRINT 3*2+2

The answer to the first problem is 12; the answer to the second problem is 8. In the first problem, the computer first adds 2 and 2, then multiplies by 3 to arrive at 12. In the second problem, the computer multiplies 3 and 2 first, then adds 2 to arrive at 8. Whenever the computer encounters parentheses in a math problem, it does the computations inside the parentheses first and then finishes the rest of the calculations.

Try out the problems below to discover some other interesting facts about how your computer works. See if you can predict the answers before you press [Return]:

PRINT (2+2)*3

PRINT 2+2*3

In the first problem, the computer does the computation inside the parentheses first. In the second problem, the computer does the multiplication first, then the addition. The computer executes these mathematical functions according to rules of order: first, computations inside parentheses; second, exponential functions; third, multiplication and division functions as they appear in the problem from left to right; and last, addition and subtraction functions from left to right. The rules are summarized in the following table:

Order of Mathematical Execution

- | | | |
|--------|-----------------------------|------------------------|
| 1. () | Computations in parentheses | |
| 2. ^ | Exponential functions | |
| 3. * | Multiplication | In order of appearance |
| / | Division | from left to right |
| 4. + | Addition | In order of appearance |
| - | Subtraction | from left to right |

Random Numbers

The computer can perform other functions that your calculator most likely cannot do. For example, your computer can pick random numbers for you. Type the program below:

NEW

10 PRINT RND (0)

20 GOTO 10

RUN

RND is the command for generating random numbers. The infinite loop in the program above will generate random numbers endlessly. Remember to break the loop with the [Break] key. To make changes in the program, you can just list the program and use the cursor keys to insert characters, rather than retype entire lines. Try out the various programs below:

```
10 PRINT RND (1)
RUN
10 PRINT RND (123)
RUN
10 PRINT RND (50)
RUN
10 PRINT RND (50000)
RUN
```

All four variations of line 10 generate random numbers between 0 and 1. The decimal point is always before the first digit in a random number. The few random numbers that have a number on the left side of the decimal point are still between 0 and 1 but are so small that the computer has written them in scientific notation.

The number in the parentheses is called a "dummy variable." It does not matter what number is used as the dummy variable, but it is important that the parentheses appear and that they enclose something (any number or letter). For typing ease, 0 is usually placed in the dummy variable position. Change line 10 again as shown below:

```
10 PRINT (RND(0) * 10)
RUN
10 PRINT (RND(0) * 100)
RUN
10 PRINT (RND(0) * 1000)
RUN
```

Each program generates a different range of random numbers. PRINT (RND(0) * 10) generates numbers up to 10 because the statement instructs the computer to multiply the random number by 10. Multiplying by 10 moves the decimal point over one place. In PRINT (RND(0) * 100), multiplying by 100 moves the decimal point over two places, and in PRINT (RND(0) * 1000), multiplying by 1000 moves the decimal point over three places. If you want, you can multiply by much larger numbers to generate large random numbers.

Because long numbers with many digits after the decimal point are cumbersome, the computer has an instruction that tells it to print only integers. Integers are whole numbers without any decimal points. The instruction INT tells the computer to drop everything after the decimal point. Reprogram the three variations of line 10 on the preceding page and compare the results:

```
10 PRINT INT(RND(0)*10)
RUN
10 PRINT INT(RND(0)*100)
RUN
10 PRINT INT(RND(0)*1000)
RUN
```

The programs generate numbers in the same ranges as before, but the numbers are more readable without the digits after the decimal.

To generate numbers in a more specific range, try the examples below:

```
10 PRINT INT(RND(0)*3)
RUN
10 PRINT INT(RND(0)*12)
RUN
10 PRINT INT(RND(0)*25)
RUN
```

The program generates random numbers that are always one less than the number by which they are multiplied. The first line 10 generates the numbers 0, 1, and 2. To generate random numbers 0, 1, 2, and 3, the program would be written this way:

```
10 PRINT INT(RND(0)*4)
RUN
```

To generate only the numbers 1, 2, and 3, the program should look like this:

```
10 PRINT INT(RND(0)*3)+1
RUN
```

To generate three numbers starting at 20, write the program this way:

```
10 PRINT INT(RND(0)*3)+20
RUN
```

Random Number Game

Random number programs are very flexible. You can even use them to play games with your computer. Type the following program. Remember that to get the bent arrow in line 5, press [Esc], hold down [Shift] or [Control], and press [Clear].

```
NEW
1 REM *** NUMBER.GAM ***
5 PRINT "↵"
10 SECRETNUM=INT(RND(0)*3)+1
20 PRINT: PRINT "I AM THINKING OF A NUMBER, EITHER 1, 2,
OR 3. TRY TO GUESS IT."
30 INPUT GUESS
40 IF GUESS=SECRETNUM THEN PRINT "YOU WON."
50 IF GUESS<>SECRETNUM THEN PRINT "YOU LOST."
60 GOTO 10
```

Line 10 assigns the random number to the numeric variable called SECRETNUM. Line 30 lets the user type in a guess and assigns this number to the numeric variable called GUESS. (Remember that numeric variables do not need to be dimensioned or tagged at the end the way that string variables do.) Line 40 compares the guess to the secret number. If they equal each other, the computer prints:

YOU WON.

Line 50 also compares the guess to the secret number. If they are not equal (the symbols < > mean not equal to), the computer prints:

YOU LOST.

Line 60 makes a loop so that you can play the game again. (Chapter 6 explains IF-THEN statements in more detail.)

Math Programs

The computer's mathematical functions can be used for work purposes, as well as for play. If you were a chef who prepared food for banquets, you might need a computer to expand your recipes. For instance, suppose that you are trying to figure out how many pounds of sea scallops to buy to serve Coquilles St. Jacques at a dinner for 62 guests. Your recipe indicates that $1\frac{1}{2}$ pounds of scallops feeds 5 people. The program below would tell you how many pounds to buy:

```
NEW
1 REM *** COQUILLE ***
10 PRINT "K"
20 GUESTS=62
30 POUNDSTOBUY=1.5/5 * GUESTS
40 PRINT:PRINT "BUY ";POUNDSTOBUY;" POUNDS OF SCALLOPS."
50 END
```

The program produces the answer (18.6 pounds of scallops), but a calculator would achieve the same result with less work. To make the program more useful, allow a variation in the number of guests by inserting an INPUT statement. Type in the additional lines below:

```
15 PRINT:PRINT "HOW MANY GUESTS DO YOU EXPECT?"
20 INPUT GUESTS
```

Run the program several times, entering a different number of guests each time. The amount of scallops needed changes each time. For 200 guests, 60 pounds of scallops are required; for 436 guests, 130.8 pounds. The INPUT function makes the program more practical.

CHAPTER 6

MAKING DECISIONS AND SOLVING PROBLEMS WITH BASIC

□ □ □ □ □ □ □ □ □ □ □ □ □ □ □ □

The IF-THEN and FOR-NEXT commands enable you to write programs that mimic the way humans approach a decision or a problem. Especially useful for games and logic puzzles, the commands let you, the programmer, make the choices for the computer.

IF-THEN Commands

To practice the IF-THEN statement, type in the following program:

```
NEW
1 REM *** BRNPROBE.QZ ***
5 PRINT " "
10 DIM RAIN$ (3)
20 PRINT:PRINT "YES OR NO, IF IT WERE RAINING OUTSIDE, WOULD
YOU GO OUT WITH AN UMBRELLA"
30 INPUT RAIN$
40 IF RAIN$="YES" THEN PRINT "YOU HAVE A FORMIDABLE IQ."
50 IF RAIN$="NO" THEN PRINT "YOU ARE A BORN RISK TAKER."
```

The Brainprobe Quiz evaluates your answer. In line 40, if the answer stored in the string variable RAIN\$ is yes, the computer prints the IQ message. If the answer is NO, the computer reads the next line, line 50, and evaluates the string variable RAIN\$ again, then prints the risk-taker message. However, if you answer neither yes nor no, the program just ends. The program has no instructions for responding to an indefinite answer. Try it out.

One way to encourage an expected reply is to create an infinite loop. Insert the additional line below:

```
60 GOTO 20
```

Evaluating with IF-THEN

Another way to encourage a correct answer is to provide hints. The following program uses numeric variables to elicit a correct response:

```
NEW
1 REM *** NUMBER.QZ ***
5 PRINT " "
10 SECRETNUM=INT(RND(0)*10)+1
20 PRINT:PRINT "GUESS A SECRET NUMBER BETWEEN 1 AND 10."
30 PRINT
40 PRINT "YOUR GUESS";
50 INPUT GUESS
60 PRINT
70 IF GUESS=SECRETNUM THEN PRINT "YOU GOT IT!":END
80 IF GUESS<SECRETNUM THEN PRINT "TOO LOW. TRY AGAIN.":
GOTO 40
90 IF GUESS>SECRETNUM THEN PRINT "TOO HIGH. TRY AGAIN.":
GOTO 40
```

Lines 80 and 90 evaluate the guess as greater than or less than the secret number. The PRINT statement provides a hint that the next guess should be higher or lower. The GOTO commands in lines 80 and 90 create an infinite loop if you continue to guess incorrectly.

Ending the Program

The Number Quiz is programmed to stop only when you discover the secret number. When you enter the correct answer, line 70 gives the computer the instruction to end. END stops the program, and the Ready prompt appears on your screen.

Trapping Errors

If you accidentally enter a letter instead of a number for GUESS, the computer sends an Error message, and the program ends abruptly. Make an intentional error by typing a letter key or pressing [Return] only. To avoid ending the program, you can use a TRAP command to trap the Error message. Add the lines below and run the program again:

```
45 TRAP 100
100 PRINT:PRINT "PLEASE ENTER A NUMBER ONLY."
110 GOTO 30
```

In line 45, the TRAP command tells the computer not to stop the program when a mistake is entered and sends the computer to line 100. Line 100 tells the computer to print the directions for correcting the mistake. Line 110 returns the computer to the place where it left off. The TRAP statement always comes before the INPUT statement, and it always contains the number of the line that will resolve the problem.

Quiz Writing with IF-THEN

A program can easily provide hints when the correct answer is a number, including a date. The following program uses IF-THEN statements and the TRAP command to evaluate guesses:

```
NEW
1 REM *** LOVELACE.QZ ***
5 PRINT " "
10 PRINT:PRINT "ADA LOVELACE, DAUGHTER OF THE POET LORD
    BYRON, WAS MATHEMATICALLY BRILLIANT."
20 PRINT
30 PRINT "IN WHAT YEAR DID SHE WRITE HER AMAZINGLY
    ACCURATE DESCRIPTION OF THE FUTURE USES OF THE COMPUTER";
40 TRAP 200
50 INPUT GUESS
60 IF GUESS=1842 THEN GOTO 100
70 IF GUESS<1842 THEN GOTO 110
80 IF GUESS>1842 THEN GOTO 120
100 PRINT:PRINT "CONGRATULATIONS! YOU GUESSED THE YEAR
    CORRECTLY." :END
110 PRINT:PRINT "THAT WAS TOO EARLY. TRY AGAIN.":GOTO 20
120 PRINT:PRINT "THAT WAS TOO LATE. TRY AGAIN.":GOTO 20
200 PRINT:PRINT "PLEASE ENTER A NUMBER ONLY."
210 GOTO 20
```

In the Lovelace Quiz, the placement of the PRINT messages associated with the IF-THEN statements is different from their placement in the Brainprobe Quiz and the Number Quiz. This difference illustrates that there is often more than one way to achieve the same results in programming.

Computer Bugs

The TRAP statement makes the Lovelace Quiz more error proof, but it still is not perfect. Because the computer evaluates the date as a number, it will accept 1842.78 as incorrect but 1842,78 as correct. Most programs have "bugs," or problems. When you can figure out the bugs and fix them, you have really learned to program. Every beginner encounters many bugs and makes many mistakes. To become a better programmer, study this manual and perhaps have a more experienced person look over your shoulder occasionally. You will learn how to identify bugs so that you can avoid similar mistakes in future programs.

FOR-NEXT Loop: The Counting Loop

You are already familiar with the infinite GOTO loop. Another kind of loop is the FOR-NEXT loop. The FOR-NEXT loop is a counting loop, which is not infinite. Type NEW and enter the following program:

```
NEW
10 FOR X=1 TO 4
20 PRINT "POTATO"
30 NEXT X
RUN
```

POTATO appears on the screen four times. Change line 10 to read like this:

```
10 FOR X=1 TO 7
```

When you run the program this time, the screen shows POTATO seven times. The computer is looping seven times through lines 10, 20, and 30. FOR tells the computer how many times to loop, and NEXT tells the computer to go back to the top and start again. NEXT is similar to GOTO. X is a variable. You can use anything to represent the variable. Try this name for the variable:

```
10 FOR NUM=1 TO 7
30 NEXT NUM
```

When you run the program, there is no difference from the previous program. Change the variable name again:

```
10 FOR JKL=1 TO 7
30 NEXT JKL
```

JKL is a nonsense name for the numeric variable in the FOR-NEXT loop. Run the program to see that it, too, runs the same as before. Now add this line:

```
15 PRINT JKL,  
RUN
```

The PRINT statement in line 15 shows the value of the variable. (Put the comma in for readability.) Each time the computer repeats the FOR-NEXT loop, the variable takes on the value of the next number in the series specified in line 10. The first time, the variable is 1; the second time, 2; and so on. The last number in the FOR statement controls the number of times the computer loops through the program. Change that number in line 10 as shown below:

```
10 FOR JKL=1 TO 50  
RUN  
10 FOR JKL=1 TO 200  
RUN  
10 FOR JKL=1 TO 500  
RUN
```

Starting Point

List the program. The first number in the FOR line is the starting point for the count, and the last number is the stopping point. Even negative numbers can be the starting point for the count. Try these variations for line 10:

```
10 FOR JKL=1 TO 5  
RUN  
10 FOR JKL=0 TO 5  
RUN  
10 FOR JKL=3 TO 5  
RUN  
10 FOR JKL=10 TO 5  
RUN
```

STEP: Counting Incrementally

List the program, delete the PRINT statement in line 20 and the comma in line 15, and run the program. The computer counts and prints the numbers very quickly. Use the STEP command to make the computer count in increments. Try the program below:

```
10 FOR JKL=0 TO 500 STEP 5
RUN
10 FOR JKL=0 TO 500 STEP 2
RUN
10 FOR JKL=0 TO 500 STEP 100
RUN
10 FOR JKL=0 TO 500 STEP 7
RUN
```

The computer will obligingly count by any sequence you specify.

Counting Backward

The computer can count backward if you use the STEP -1 command and the proper sequence of numbers (from larger to smaller) for starting and stopping the count. For example:

```
10 FOR JKL=500 TO 0 STEP -1
RUN
10 FOR JKL=10 TO 0 STEP -1
RUN
10 FOR JKL=-1 TO -19 STEP -1
RUN
```

The computer can count backward in increments also:

```
10 FOR JKL=500 TO 0 STEP -20
RUN
10 FOR JKL=500 TO 0 STEP -3
RUN
10 FOR JKL=0 TO -500 STEP -50
RUN
```

You can also instruct the computer to start and stop at any number you desire:

```
10 FOR JKL=500 TO 300 STEP -10
RUN
10 FOR JKL=25 TO 0 STEP -1
RUN
```

Now you know how to instruct the computer to count forward and backward, to count consecutively and incrementally, and to start and stop at specified numbers.

The FOR-NEXT "Sandwich" Loop

List your program. FOR is on the top line, and NEXT is on the bottom line. Whatever you want the computer to do is sandwiched in between. Type in the lines below:

```
10 FOR JKL=1 TO 5
20 PRINT "AVOCADO"
```

The computer will carry out any instruction or number of instructions between the FOR and NEXT statements the specified number of times. Have the computer print other words:

```
16 PRINT "CHEESE"
17 PRINT "MAYONNAISE"
18 PRINT "MUSTARD"
19 PRINT "TOMATO"
21 PRINT "BACON BITS"
22 PRINT "LETTUCE"
23 PRINT:PRINT
RUN
```

The computer prints and counts too quickly for anyone to read the screen clearly. Nonetheless, it prints the PRINT statement exactly five times as instructed in the FOR-NEXT statement. Other instructions, such as math computations and INPUT statements, can also be part of the FOR-NEXT sandwich loop.

Delay Loops

Erase all the PRINT statements so that absolutely nothing is in the FOR-NEXT sandwich loop, except the FOR and the NEXT statements. Run the program and see what happens:

```
15
16
17
18
19
20
21
22
23
LIST
RUN
```

Nothing happens. Change the number in line 10 and watch carefully again:

```
10 FOR JKL=1 TO 500  
RUN
```

The Ready prompt takes a few seconds to appear. Change line 10 again:

```
10 FOR JKL=1 TO 5000  
RUN
```

This time the Ready prompt takes considerably longer to appear. The computer is counting but not printing its calculations. The process is similar to counting silently to yourself. The time it takes the Ready prompt to appear on the screen is the time it takes the computer to count to 5000.

FOR-NEXT loops are excellent devices for keeping the computer from moving on. In fact, FOR-NEXT loops are used so frequently for this purpose that they are sometimes called "delay loops," and the common variable name is DELAY. Rewrite the FOR-NEXT loop, using DELAY as the variable name and different numbers in the FOR statement:

```
NEW  
10 FOR DELAY=1 TO 300  
20 NEXT DELAY  
LIST  
RUN
```

Sometimes the delay loop is sandwiched on the same program line:

```
NEW  
10 FOR DELAY=1 TO 300:NEXT DELAY  
LIST  
RUN
```

Sample Programs

The programs below use FOR-NEXT loops in a variety of ways. The first program uses the FOR-NEXT loop as a simple delay loop to leave the word HI on the screen long enough to be read before line 30 clears the screen:

```
NEW
1 REM *** DLAYLOOP ***
5 PRINT "  "
10 PRINT "HI"
20 FOR DELAY=1 TO 800:NEXT DELAY
30 PRINT "  "
40 PRINT "BYE"
50 FOR DELAY=1 TO 800:NEXT DELAY
```

The next program uses a numeric variable in the FOR-NEXT loop. It also uses a TRAP command that refers the computer back to the previous line, giving no specific message about the error:

```
NEW
1 REM *** HOWHIGH? ***
10 DIM A$(1), HH$(1)
20 PRINT "  "
30 PRINT:PRINT "HOW HIGH DO YOU WANT TO COUNT";
40 TRAP 30
50 INPUT HH
55 HH$=STR$(HH): IF HH$="0" THEN GOTO 30
60 FOR COUNT=1 TO HH
70 PRINT COUNT
80 NEXT COUNT
90 PRINT :PRINT "PLEASE ANSWER (Y/N). WOULD YOU LIKE TO COUNT AGAIN";
100 TRAP 90
110 INPUT A$
120 IF A$="Y" THEN GOTO 30
130 IF A$="N" THEN PRINT:PRINT "BYE":END
140 GOTO 90
```

The last program paraphrases an old rock 'n' roll song and uses "nested" FOR-NEXT loops. A nested FOR-NEXT loop is a smaller delay loop inside a larger FOR-NEXT loop. The program also uses OR to create multiple conditions in the IF-THEN statement:

```
NEW
1 REM *** CLOCKRCK ***
5 PRINT " ⚡ "
10 FOR X=1 TO 9
20 PRINT X;
30 PRINT " O'CLOCK"
40 FOR DELAY=1 TO 500:NEXT DELAY
50 IF X=3 OR X=6 OR X=9 THEN PRINT "ROCK!": FOR PAUSE=1
   TO 500:NEXT PAUSE
60 NEXT X
70 PRINT:PRINT "WE'RE GOING TO ROCK"
80 PRINT "AROUND THE CLOCK"
90 PRINT "TONIGHT!"
```

CHAPTER 7

PRODUCING SOUND AND GRAPHICS WITH BASIC

Creating sound and graphics on some computers is very complicated, but not on the ATARI XE. The SOUND command in ATARI BASIC, combined with some simple programming techniques, is all you need. Sound and graphics add new dimensions to your BASIC programs—anything from arcade-game zaps and cracks, musical themes, and songs to colorful graphic displays.

Sounding Off

Your ATARI XE can play up to four sounds at one time. The four sound registers, or voices, are numbered 0, 1, 2, and 3. To select the first voice, you type SOUND 0; for the second, SOUND 1; for the third, SOUND 2; and for the fourth, SOUND 3.

The SOUND command in ATARI BASIC controls four elements:

- Voice (0–3)
- Pitch (0–255)
- Distortion (0–14)
- Volume (0–15)

The pitch, or frequency, of the sound is determined by a number from 0 to 255, giving you a total of 256 frequencies from which to choose. The pitch value is the second number in the SOUND command. SOUND 1,50 specifies the second voice with a pitch of 50. Make sure that the volume is turned up on your TV or monitor, then type

SOUND 1,50,0,8

Press [Return]. A great explosion, isn't it? To turn off the sound, you just turn down the volume on your television, or type either of the commands below and press [Return]:

END

SOUND 1,0,0,0

The purity, or distortion, of the sound is determined by any even number between 0 and 14. In the SOUND command, the purity of the sound is the third number. Try this:

SOUND 1,50,10,8

The number 10 produces a pure tone without distortion. To put in a little distortion, change the 10 to 06:

SOUND 1,50,06,8

The computer sounds as if it's ready for takeoff. Type END before the neighbors start complaining.

The last number in the SOUND command controls the volume. The number must be between 0 and 15. Number 8 is a good number for most uses. You risk damaging your TV speaker and your ears if you go above 12.

To try some four-part harmony, enter the following:

SOUND 0,50,10,8

SOUND 1,100,10,8

SOUND 2,150,10,8

SOUND 3,200,10,8

Type END to stop the chorus.

Sounding Off with Variables

Variables in SOUND commands add versatility to your programs. Using variables, you can program the computer to change the voice, pitch, distortion, and volume of sustained sounds. Enter and run the following program:

NEW

10 REM * SET VARIABLES FOR SOUND VALUES

20 VOICE=0:PITCH=100:TONE=8:VOL=8

30 SOUND VOICE,PITCH,TONE,VOL

40 GOTO 20

RUN

To stop the sound, press [Break] and type END. To sustain a sound, you need to repeat the SOUND command in the program. Two common methods are a FOR-NEXT loop or a GOTO loop like the one in the example above. The following program uses a variable for the pitch in a FOR-NEXT loop to produce the computer's entire range of pitches:

NEW

10 REM * SOUND EFFECTS WITH FOR-NEXT LOOP

20 VOICE=0:PITCH=0:TONE=10:VOL=8

30 FOR PITCH=0 TO 255

40 SOUND VOICE,PITCH,TONE,VOL

50 NEXT PITCH

RUN

Varying the volume in a program produces a variety of sounds. Change VOL = 8 to VOL = 0 and press [Return]. Then add the following line:

```
35 VOL=INT(RND(0)*16)
```

This line randomly selects a value between 0 and 15 for the volume variable. Run the program to find out how randomly changing the volume affects the sound.

Making Music

The SOUND command can produce musical tones as well. The following scale includes musical notes and their pitch values:

Note	Pitch	Note	Pitch
High C	29	B	64
B	31	A	72
A	35	G	81
G	40	F	91
F	45	E	96
E	47	D	108
D	53	Middle C	121
C	60		

Type and run the following program:

```
NEW
10 REM ** SIMPLE SONG
15 DIM PITCH$ (1)
20 VOICE=0:PITCH=0:TONE=10:VOL=8
30 REM ** C=121:D=108:E=96:F=91
40 TRAP 300
50 PRINT " K "
60 PRINT "NOTES FOR SIMPLE SONG"
65 FOR NOTE=1 TO 8
70 READ PITCH
80 SOUND VOICE,PITCH,TONE,VOL
90 GOSUB 200
100 PRINT:PRINT PITCH$
110 FOR PAUSE=1 TO 500:NEXT PAUSE
120 SOUND 0,0,0,0
130 NEXT NOTE
140 GOTO 300
150 REM ** DATA FOR NOTES
160 DATA 121,121,108,96,96,91,108,121
```

```

200 REM ** PRINT NOTES
210 IF PITCH=121 THEN PITCH$="C"
220 IF PITCH=108 THEN PITCH$="D"
230 IF PITCH=96 THEN PITCH$="E"
240 IF PITCH=91 THEN PITCH$="F"
250 RETURN
300 PRINT: PRINT "END OF SIMPLE SONG":END
RUN

```

The GOSUB-RETURN and READ-DATA commands allow the computer to produce different notes by inserting a series of values for the variable PITCH. GOSUB tells the computer to go to the "subroutine" that starts at line 200 and continues to line 250; the RETURN command sends the computer back to the line immediately below the GOSUB line. The READ command tells the computer to pick up an item in the DATA line and insert it into the variable. The computer continues to loop through the program until all the values in the DATA line have been used.

The program also uses a FOR-NEXT loop to determine how long the notes last. Using different FOR-NEXT loops, try modifying the program to produce whole notes, half notes, and other kinds of notes.

Colorful Graphics

Your ATARI XE has 16 graphics modes encompassing 256 colors. To get you started, this section presents 6 different modes and some of the most essential graphics commands.

The 16 basic colors and their corresponding number values are shown below. (The colors vary somewhat according to the adjustment of the hue control on your television set.)

0 Gray	8 Blue
1 Gold	9 Light Blue
2 Orange	10 Turquoise
3 Red-Orange	11 Green-Blue
4 Pink	12 Green
5 Purple	13 Yellow-Green
6 Red-Orange	14 Orange-Green
7 Blue	15 Light Orange

The remaining 112 colors are obtained by adding a value for luminance, or brightness. The luminance must be an even number between 0 and 14. The higher the luminance number, the lighter and brighter the color.

Color registers are another important element in Atari graphics. The color registers can be thought of as paint cans. Each register can hold any of the 128 colors. Because there are five registers, a maximum of five different colors can be displayed. The five color registers are numbered 0, 1, 2, 3, and 4.

SETCOLOR is an essential graphics command. The format is SETCOLOR 2,10,8: the first number is the color register; the second is the color number; and the third is the luminance.

Graphics Mode 0

The color registers function differently in different graphics modes. Their functions in graphics mode 0 (the text mode) are shown in the following table:

Default Colors	Register	Function
	0	Not used
Light Blue	1	Brightness of text
Dark Blue	2	Background
	3	Not used
Black	4	Border

The default colors are the colors that the computer automatically uses unless you instruct it to use some other colors. Using SETCOLOR to change colors, type in the following:

SETCOLOR 2,3,4

When you press [Return], the screen turns orange. The color transformation occurs because in the SETCOLOR command, the 2 represents the screen color, the 3 equals the color orange, and the 4 indicates the brightness. Change the 4 to a 6. The orange changes to a lighter orange. Change the 6 to a 7. Nothing happens because only the even numbers between 0 and 14 define the luminance. If you type an odd number, the computer uses the color of the previous even number. Change the 7 to an 8 and watch the color get lighter yet. The following program shows all 128 colors and luminances:

```
NEW
10 REM ** 128 ATARI COLORS
20 REM ** 16 COLORS
30 FOR COLOR=0 TO 15
40 REM ** 8 LUMINANCES
50 FOR LUMINANCE=0 TO 14 STEP 2
60 SETCOLOR 2,COLOR,LUMINANCE
65 PRINT "COLOR=";COLOR;"
LUMINANCE=";LUMINANCE
70 REM ** PAUSE TO SEE COLOR
80 FOR PAUSE=1 TO 600:NEXT PAUSE
90 NEXT LUMINANCE
100 NEXT COLOR
RUN
```

When the luminance reaches number 10, the text disappears because the default luminance of the text is also 10. (The default luminance is the luminance that the computer automatically uses unless it is instructed to do otherwise.) Whenever the background luminance is the same as the text luminance, the text seems to disappear. Pay attention to background and text luminances as you work more with color and luminance in graphics mode 0. Type GR.0 (which is an abbreviation for graphics mode 0) to restore the normal screen colors.

Change SETCOLOR 2 to SETCOLOR 4 in line 60 and run the program again. Because register 4 governs the border, the border changes color this time instead of the background area. Type GR.0 to restore the normal screen colors.

Graphics Modes 1 and 2

Graphics modes 1 and 2 provide large-size text and color options. Graphics mode 2 is identical to graphics mode 1 except that each character is twice as tall. Mode 1 has 24 horizontal screen lines, and mode 2 has 12. To enter graphics mode 1, type the following:

```
NEW
10 GRAPHICS 1
20 PRINT #6;"GRAPHICS MODE ONE"
```

Run the program. Graphics mode 1 is in orange text at the top of the screen. At the bottom is a blue strip containing the word READY. The blue strip is the text window and displays text in graphics mode 0. Type GR.0 to return to the text mode.

To print large text on the screen in graphics modes 1 and 2, use PRINT #6; followed by quotes and then the text that you want to print. This statement is a variation on the PRINT command that you learned earlier.

Now list the program. Change MODE to mode and run the program. MODE turns green. Type LIST 20. Using the Inverse Video key , change mode in line 20 to **MODE** and run the program. MODE now turns blue. List the line again and change **MODE** to **mode** and run the program. Now MODE is red.

Enter and run the following program:

```
NEW
10 REM ** COLORFUL TEXT
20 GRAPHICS 1
30 PRINT #6;"ORANGE"
40 PRINT #6;"green"
50 PRINT #6;"DARK BLUE"
60 PRINT #6;"red"
70 PRINT "COLORFUL TEXT"
RUN
```

As you can see, graphics mode 1 is capable of displaying five colors at the same time—four different text colors and one background color. The colors can also be changed by using SETCOLOR according to the guidelines outlined in the following table:

Register	Default Color	Character Style	Color#	LUM
0	Orange	Uppercase	2	8
1	Light Green	Lowercase	12	10
2	Dark Blue	Inverse uppercase	9	4
3	Red	Inverse lowercase	4	6
4	Black	Background	0	0

Type SETCOLOR 4,15,5. Register 4 (the background) changes to a reddish orange. But now the dark blue text is difficult to read. Use SETCOLOR to change it. According to the table, register 2 controls the dark blue text. SETCOLOR 2,8,6 does the trick by making the dark blue text a little bit lighter. Add the following lines to the Colorful Text program:

```
100 FOR COLOR=0 TO 15
110 SETCOLOR 2,COLOR,8
120 FOR DELAY=1 TO 400:NEXT DELAY
130 NEXT COLOR
```

Run the program. The text window at the bottom of the screen changes color along with the dark blue text because register 2 governs the text window as well as the text display.

Getting Rid of the Text Window

Sometimes you may not want the text window to appear in your programs. To eliminate the text window, simply add 16 to the graphics mode number. Change line 20 to GRAPHICS 17 and delete line 70. The PRINT command will always print in graphics mode 0. If you are in modes 1 or 2, if you don't have a text window, and if you use the PRINT command and the PRINT #6; command, the computer gets confused and prints everything in mode 0. Add this line:

```
70 PRINT "WINDOW TEST"
```

Run the program to see what happens. If you use PRINT and PRINT #6; you must use a text window to have mode 1 show up on the screen.

Delete lines 100, 110, 120, and 130. Run the program. WINDOW TEST and then READY appear at the top of the screen. List the program. Line 20 specifies mode 17 (mode 1 without the text window), but where is it? Replace line 70 with this line:

```
70 GOTO 70
```

When you run the program, the mode 1 screen comes back. When you use mode 1 or 2 without a text window, you must use a GOTO loop to keep the display on the screen or it will flash by too fast to be seen. Pressing [Break] returns you to mode 0.

To see an example of mode 2, list the Colorful Text program and change line 20 to:

```
20 GRAPHICS 18
```

Graphics 18 stands for mode 2 plus 16 (no text window). Run the program. Now you have LARGE colorful text.

To return the screen to its original colors, press the [Reset] button or type SETCOLOR 2,9,4. You will not lose your program when you press [Reset] in ATARI BASIC. However, that feature may not apply to other languages or programs.

Graphics Mode 3

The graphics mode 3 screen is a grid consisting of 40 columns and 24 rows (20 if you use the text window). Enter and run the following program:

```
NEW  
10 GRAPHICS 3  
20 COLOR 1  
30 PLOT 0,0  
RUN
```

In the upper left corner is an orange block. The block, or pixel, is one unit in the graphics screen. The COLOR command determines the color of the pixel. The number after the COLOR command determines which color register to use for the color of the pixel. The COLOR command does not place a color in the register; SETCOLOR does that. The COLOR command simply selects which register to use to plot the pixel, and the pixel becomes whatever color is in the register. To make this clearer, change line 20 to:

```
20 COLOR 2
```

Run the program. The orange pixel is now light green. Think of each pixel as a text character. In modes 1 and 2, you used uppercase and lowercase characters and Inverse Video to select the colors of the text. In modes 3 and above, use the COLOR command to select the color for the pixels.

PLOT: Plotting Points on the Grid

PLOT is like the PRINT #6; command except that it prints pixels instead of letters and numbers. COLOR is like the upper/lower/inverse color selection method; it selects the register. The default colors are orange, light green, dark blue, and black. To change the color in any of the registers, use the SETCOLOR command.

The color registers are like four buckets of paint. SETCOLOR selects the color that goes into each of the four buckets, and COLOR selects the bucket into which the paintbrush will be dipped. PLOT determines where the brush will be positioned on the screen.

DRAWTO: Connecting the Dots

Add this line:

```
40 DRAWTO 39,0
```

Run the program. A light green line goes across the top of the screen. After plotting a pixel, use the DRAWTO command to plot a second pixel and draw a connecting line between the two. Line 40 tells the computer to plot a pixel at column 39, row 0, and then connect them. Now type:

```
DRAWTO 39,19
```

The command plots a pixel in the bottom right corner of the graphics screen, just above the text window, and then draws a line to connect pixel coordinates 39,0 to 39,19. Now type:

```
DRAWTO 0,19
```

To complete the rectangle, type:

```
DRAWTO 0,0
```

Now type GR.0 and list the program. Add these lines:

```
50 DRAWTO 39,19
```

```
60 DRAWTO 0,19
```

```
70 DRAWTO 0,0
```

SETCOLOR and COLOR

When you run the program, the computer draws a green rectangle again. To brighten up the screen, type:

```
35 COLOR 1  
45 COLOR 2  
55 COLOR 1  
65 COLOR 3
```

Run the program to see a rectangle of many colors.

To change the color in a register, use SETCOLOR. You might conclude that COLOR 1 selects the color for register 1 and that COLOR 2 selects the color for register 2. Unfortunately, that conclusion is not true. Mode 3 has four registers and four colors—but the registers are numbered 0, 1, 2, and 4, and the colors are numbered 0, 1, 2, and 3. To keep things straight, make a list:

Color 0 = Register 4 Black
Color 1 = Register 0 Orange
Color 2 = Register 1 Light Green
Color 3 = Register 2 Dark Blue

Type GR.0, list the program, and change COLOR 2 in line 20 to COLOR 1. COLOR 1 selects register 0; and orange is the default color for register 0. To change the color in register 0, use the SETCOLOR command. Add the following line:

```
15 SETCOLOR 0,4,6
```

When you run the program, the orange lines change to a pinkish color. You have changed the color of the lines by using SETCOLOR to change the paint in the bucket (the color in the register), not by using COLOR to choose a different bucket (register). The color luminance of register 0 also affects the luminance of the text in the text window.

Now add:

```
42 SETCOLOR 1,2,8
```

The light green at the right side of the box turns gold. Add one more line:

```
62 SETCOLOR 2,11,4
```

Run the program. Not only does the left side of the box change to green, but the text window also turns green. Therefore, register 2 also controls the color of the text window.

Now you should be able to use SETCOLOR and COLOR to achieve a wide variety of colors and hues in your programs.

Graphics Modes 5 and 7

The differences among modes 3, 5, and 7 can be illustrated very easily. Change line 10 to:

10 GRAPHICS 5

Run the program. The rectangle is much smaller because the pixels are smaller. With the text window, the mode 3 grid has 39 columns and 20 rows. The mode 5 grid has 80 columns and 40 rows.

Now change line 10 to:

10 GRAPHICS 7

When you run the program, an even smaller rectangle appears. The grid in mode 7 is 160 columns by 80 rows.

The smaller the pixels, the higher the resolution. Of the three modes, mode 3 is the lowest and mode 7 is the highest. Try drawing a rectangle around the screen borders in modes 5 and 7.

The following program illustrates all that you have tried in this section. Type it in and run it:

```
NEW
5 REM ** BILL'S BOX (PLOT AND DRAW)
10 PRINT "WHICH MODE (3,5,OR 7)";
20 LEFT=0:TOP=0
30 INPUT MODE
40 IF MODE=3 THEN RIGHT=39:BOTTOM=19
50 IF MODE=5 THEN RIGHT=79:BOTTOM=39
60 IF MODE=7 THEN RIGHT=159:BOTTOM=79
70 GRAPHICS MODE
80 PRINT "      GRAPHICS MODE ";MODE
90 FOR COUNT=1 TO 1000
100 COLOR 2
110 TRAP 240
115 REM ** DRAW BOX
120 PLOT LEFT,TOP
130 COLOR 1
140 DRAWTO RIGHT,TOP
```

```
150 COLOR 2
160 DRAWTO RIGHT,BOTTOM
170 COLOR 1
180 DRAWTO LEFT,BOTTOM
190 COLOR 3
200 DRAWTO LEFT,TOP
205 REM ** DELAY LOOP
210 FOR DELAY=1 TO 500:NEXT DELAY
215 REM ** SIZE OF NEXT BOX
220 LEFT=LEFT+2:TOP=TOP+2:RIGHT=RIGHT-2:BOTTOM=
    BOTTOM-2
230 NEXT COUNT
240 PRINT "          THAT'S ALL FOLKS!"
250 END
```

Try using SETCOLOR to change the colors in the Bill's Box program.

APPENDIX A

SAMPLE BASIC PROGRAMS

□ □ □ □ □ □ □ □ □ □ □ □ □ □ □ □

Your ATARI XE can work miracles with a little help from your imagination and the right programming techniques. These sample programs will show off the versatility of your ATARI XE and motivate you to try writing some programs yourself.

Just type in each program exactly as written, pressing [Return] at the end of every line. When you're finished, type the word RUN, press [Return], and watch your ATARI XE come to life.

Note: When spacing in program lines is critical, a note at the bottom of the program will specify the exact number of spaces needed.

The Atari Choo-Choo

Sound effects are an Atari specialty. If you close your eyes when you run Atari Choo-Choo, you might think you're on the Marrakesh Express.

```
10 POKE 764,255:POKE 580,1
20 GRAPHICS 17:POKE 712,148: POSITION 1,10:PRINT #6; "THE
   ATARI CHOO-CHOO"
30 FOR X=15 TO 0 STEP -1:P:SOUND 1,0,0,X

United States Flag

This program involves switching colors to set up the stripes. It uses graphics mode 7 plus 16 so that the display appears as a full screen. Note the correspondence of the COLOR statements with the SETCOLOR statements. For fun and experimentation purposes, add a SOUND statement and use a READ/DATA combination to add "The Star Spangled Banner" after line 470.

```

Igpay Atinlay

This short program converts words or sentences into pig Latin. One word of caution, though; don't enter any one-letter words like A or I.

```

10 DIM A$(256):S=2
20 ? "Type in a word or sentence. Please don't exceed three
lines of text."
30 INPUT AS
40 FOR X=1 TO LEN(AS)
50 IF AS(X,X)=CHR$(32) THEN PRINT AS$(S,X-1);AS$(S-1,S-1);
"AY";" " :S=X+2
60 IF X=LEN(AS) THEN PRINT AS$(S,X); AS$(S-1,S-1); "AY"
70 NEXT X
80 ? :? :? "THAT'S ALL FOLKS!"

```

Grapheek

Just type this one in and watch the graphics action.

```

10 DIM A$(35)
20 GRAPHICS 1
25 TRAP 90
30 A$="THIS IS A GRAPHICS DEMONSTRATION."
40 FOR I=1 TO 33:? #6;A$(I,I);
50 S=PEEK(53770)
60 SOUND 0,S,10,14
70 FOR DELAY=0 TO 100:NEXT DELAY
80 NEXT I
90 SOUND 0,0,0,0:END

```

Note: Make sure you insert two spaces between GRAPHICS and DEMONSTRATION in line 30.

Esrever

The title of this program is simply the word REVERSE printed in reverse. To print words spelled backward, just type in this short program. After you run it, a question mark will appear on your screen. Enter a word or a short sentence and let your ATARI XE do all the work.

```
10 DIM A$(180)
20 PRINT "Enter a word or short sentence and press Return."
30 INPUT A$
40 FOR X=LEN(A$) TO 1 STEP -1
50 PRINT A$(X,X);
60 NEXT X
70 PRINT :PRINT :GOTO 20
```

Protecting Your Program

Ever wonder how you could protect your programs from prying eyes and quick fingers? A couple of programming tips can help keep pilferers out of your programs.

First type in this program:

```
10 FOR X=1 TO 50:POKE 710,X: NEXT X:GOTO 10
```

To protect the program, add another program line to disable the [Break] key. This line prevents someone from breaking into the program and listing it while it's running. Also, if you design a program that requires keyboard entry, disabling the [Break] key protects against "finger slip," that dreaded mishap when your finger accidentally hits the [Break] key and brings your program to a screeching halt.

Delete GOTO 10 from the colorful program and add this line:

```
20 POKE 16,64:POKE 53774,64:GOTO 10
```

Now run your new program and try to stop it by pressing the [Break] key. You can't get into it.

To be effective, the POKE statements must be inserted in your program after each graphics mode command.

Disabling the **[Break]** key has its limitations. Some smart programmer will figure out that he or she can break into your program and list it by simply pressing the **[Reset]** key. To foil this culprit, add this line to your program:

5 POKE 580,1

Now when the inquisitive intruder presses **[Reset]**, the flashing colors program is purged from the computer's memory—no program, no listing! The POKE statement should always be at the beginning of your program.

Sea Gull Over Ocean

This program combines graphics and sounds. The sounds are not "pure" sounds; they simulate the roar of the ocean and the gull's cry. To get the symbols in line 20, use [Control] [G], [Control] [F], [Control] [R], [Control] [R].

```
10 DIM BIRD$(4)

```

APPENDIX B

BASIC RESERVED WORDS

□ □ □ □ □ □ □ □ □ □ □ □ □ □ □ □

Note: The period is mandatory after all abbreviated keywords.

Reserved Word	Abbreviation	Brief Summary of BASIC Statements
ABS		Returns the absolute (unsigned) value of the variable or expression.
ADR		Returns the memory address of a string variable.
AND		Functions as a logical operator. The expression is true only if both sub-expressions joined by AND are true.
ASC		Returns the numeric value of a single string character.
ATN		Returns the arctangent of a number or expression in radians or degrees.
BYE	B.	Exits from BASIC and returns to the resident operating system or console processor.
CLOAD	CLOA.	Loads data from the program recorder into RAM.
CHR\$		Returns a single string byte equivalent to a numeric value between 0 and 255 in ATASCII code.
CLOG		Returns the base 10 logarithm of an expression.
CLOSE	CL.	Closes a file at the conclusion of I/O operations. Functions as an I/O command.
CLR		Performs the opposite function of DIM: undimensions all strings and matrices.
COLOR	C.	Chooses the color register to be used in color graphics work.
COM		Performs the same function as DIM.
CONT	CON.	Stands for "continue." Causes a program to restart execution on the next line after being stopped by the [Break] key or encountering STOP.

Reserved Word	Abbreviation	Brief Summary of BASIC Statements
COS		Returns the cosine of the variable or expression in degrees or radians.
CSAVE		Outputs data from RAM to the program recorder for tape storage.
DATA	D.	As part of the READ-DATA combination, identifies the succeeding items (which must be separated by commas) as individual data items.
DEG	DE.	Tells the computer to perform trigonometric functions in degrees instead of radians. (The default measurement is in radians.)
DIM	DI.	Reserves the specified amount of memory for matrix, array, and string variables. (All string variables, arrays, and matrices must be dimensioned with a DIM statement.)
DOS	DO.	Stands for "Disk Operating System." Causes the menu to be displayed. (See DOS manual.)
DRAWTO	DR.	Draws a straight line between a plotted point and a specified point.
END		Stops program execution; closes files; turns off sounds. May be used more than once in a program. (CONT can be used to restart the program.)
ENTER	E.	Stores data or program in untokenized (source) form. Functions as an I/O command.
EXP		Returns e (2.7182818) raised to a specified power.
FOR	F.	Used with NEXT to establish FOR-NEXT loops. Introduces the range that the loop variable will operate in during the execution of the loop.
FRE		Returns the amount of remaining user memory in bytes.
GET	GE.	Used mostly with disk operations to input a single byte of data.
GOSUB	GOS.	Branches to a subroutine beginning at a specified line number.
GOTO	G.	Branches unconditionally to a specified line number.

Reserved Word	Abbreviation	Brief Summary of BASIC Statements
GRAPHICS	GR.	Specifies one of the 16 graphics modes. (GR.0 can be used to clear the screen.)
IF		Causes conditional branching or the execution of another statement on the same line (only if the first expression is true).
INPUT	I.	Causes the computer to ask for input from the keyboard. Execution continues only when the [Return] key is pressed after data has been input. Also functions as an I/O command.
INT		Returns the next lowest whole integer below a specified value. (Rounding is always downward, even when the number is negative.)
LEN		Returns the length of the specified string in bytes or characters. (One byte contains one character.)
LET	LE.	Assigns a value to a specific variable name. (LET is optional in ATARI BASIC and can be omitted.)
LIST	L.	Displays or otherwise outputs the program list.
LOAD	LO.	Inputs from a disk into the computer.
LOCATE	LOC.	Stores in a specified variable the value that controls a specified graphics point.
LOG		Returns the natural logarithm of a number.
LPRINT	LP.	Commands the line printer to print a specified message.
NEW		Erases all contents of user RAM.
NEXT	N.	Causes a FOR-NEXT loop to terminate or continue, depending on the particular variables or expressions. (All loops are executed at least once.)
NOT		Returns a 1 only if the expression is NOT true; returns a 0 if it is true.
NOTE	NO.	Used only in disk operations. (See DOS manual.)

Reserved Word	Abbreviation	Brief Summary of BASIC Statements
ON		Used with GOTO or GOSUB for branching purposes. (Multiple branches to different line numbers are possible, depending on the value of the ON variable or expression.)
OPEN	O.	Opens the specified file for input or output operations.
OR		Used as a logical operator between two expressions. If either one is true, a 1 is evaluated; if both are false, a 0 results.
PADDLE		Returns the position of the paddle game controller.
PEEK		Returns the decimal form of the contents of a specified memory location (RAM or ROM).
PLOT	PL.	Plots a single point at a specified X,Y location.
POINT	P.	Used only in disk operations. (See DOS manual.)
POKE	POK.	Inserts the specified byte into the specified memory location. May be used only with RAM.
POP		Removes the loop variable from the GOSUB stack. Used when departure from the loop is made in an other-than-normal manner.
POSITION	POS.	Sets the cursor at a specified screen position.
PRINT	PR. or ?	Causes output from the computer to the specified output device. Functions as an I/O command.
PTRIG		Returns the status of the trigger button on a game controller.
PUT	PU.	Causes output of a single byte of data from the computer to the specified device.
RAD		Tells the computer to give information in radians, rather than in degrees, for trigonometric functions. (The default measurement is radians. See DEG.)

Reserved Word	Abbreviation	Brief Summary of BASIC Statements
READ	REA.	Reads the items in the DATA list and assigns them to specified variables.
REM	R.	Stands for "remarks." Does nothing but allows comments to be printed in the program list for the programmer's future reference. REM statements are not executed.
RESTORE	RES.	Allows data to be read more than once.
RETURN	RET.	Returns the computer from a sub-routine to the statement immediately following the one in which GOSUB appears.
RND		Returns a random number between 0 and 1, but never 1.
RUN	RU.	Executes the program; sets normal variables to 0; undimensions arrays and strings.
SAVE	S.	Causes data and programs to be recorded on disk under the filespec provided with SAVE. Functions as an I/O command.
SETCOLOR	SE.	Stores hue and luminance color data in a particular color register.
SGN		Returns +1 if the value is positive; 0, if zero; -0, if negative.
SIN		Returns the trigonometric sine of a given value in degrees or radians.
SOUND	SO.	Controls register, pitch, distortion, and volume of a tone or note.
SQR		Returns the square root of a specified value.
STATUS	ST.	Calls status routine for a specified device.
STEP		Used with FOR-NEXT. Determines the quantity to be skipped between each pair of loop variable values.
STICK		Returns the position of the stick game controller.
STRIG		Returns 1 if stick trigger button is not pressed; 0, if pressed.

Reserved Word	Abbreviation	Brief Summary of BASIC Statements
STOP	STO.	Causes the program to stop but does not close files or turn off sounds.
STR\$		Returns a character string equal to the numeric value given. (For example, STR\$(65) returns 65 as a string.)
THEN		Used with IF. If the expression is true, the THEN statements are executed. If the expression is false, control passes to the next line.
TO		Used with FOR, as in "FOR X = 1 TO 10." Separates the loop range expressions.
TRAP	T.	Takes control of the program in case of an INPUT error and directs execution to a specified line number.
USR		Returns the results of a machine-language subroutine.
VAL		Returns the equivalent numeric value of a string.
XIO	X.	Used with disk operations (see DOS manual) and in graphics work. Functions as a general I/O statement.

APPENDIX C

ATASCII CHARACTER SET

Decimal Code	Hexadecimal Code	ATASCII Character	Keystrokes	European Character
0	0		Control	á
1	1		Control A	ù
2	2		Control B	Ñ
3	3		Control C	É

11	B		Control K	ä
12	C		Control L	Ö
13	D		Control M	ú
14	E		Control N	ó
15	F		Control O	ö
16	10		Control P	Û
17	11		Control Q	â

Notes

ATASCII stands for ATARI ASCII. Letters and numbers have the same values as those in ASCII, but some of the special characters are different.

Except as shown, the characters from 128 to 255 are the reverse colors of 1 to 127.

Add 32 to the uppercase code to get the lowercase code for the same letter.

To get the ATASCII code, tell the computer (direct mode) to PRINT ASC ("____"). Fill the blank with a letter or a character. You must use the quotes.

The normal display keycaps are shown as white symbols on a black background; the inverse keycap symbols are shown as black symbols on a white background.

APPENDIX D ERROR MESSAGES

□ □ □ □ □ □ □ □ □ □ □ □ □ □ □ □

CODE MESSAGE

- 2 **Insufficient Memory** Not enough RAM memory is left to store the statement or the new variable name, or to dimension a new string array variable.
- 3 **Value Error** A value expected to be a positive integer is negative; a value is not within a specific range.
- 4 **Too Many Variables** The maximum of 128 different variable names has been exceeded.
- 5 **String Length Error** The user attempted to store string variables that exceeded the dimensioned string length.
- 6 **Out of Data** The READ statement requires more data items than the DATA statement(s) supplied.
- 7 **Line Number Greater Than 32767** The line number reference is greater than 32767.
- 8 **Input Statement Error** The user attempted to input a non-numeric value into a numeric variable.
- 9 **Array or String DIM Error** The DIM size exceeded 5460 for numeric arrays or 32767 for strings; an array or string was redimensioned; reference was made to an undimensioned array or string.
- 11 **Floating Point Overflow/Underflow** The user attempted to divide by zero or to refer to a number larger than 1×10^{99} or smaller than 1×10^{-99} .
- 12 **Line Not Found** A GOSUB, GOTO, or THEN referenced a nonexistent line number.
- 13 **No Matching FOR Statement** A NEXT was encountered without a previous FOR, or nested FOR/NEXT statements do not match properly. (The Error message is reported at the NEXT statement, not at FOR.)
- 14 **Line Length Error** The statement is too complex or too long for BASIC to handle.
- 15 **GOSUB or FOR Line Deleted** A RETURN or NEXT statement was encountered, but the corresponding GOSUB or FOR has been deleted since the last RUN command.
- 16 **RETURN Error** A RETURN was encountered without a matching GOSUB.

- 17 **Syntax Error** The computer encountered a line with improper syntax.
- 18 **Invalid String Character** The string in the VAL statement is not a numeric string.

The following errors are INPUT/OUTPUT (I/O) errors that result during the use of disk drives, printers, or other accessory devices. Further information is provided with the auxiliary hardware.

- 19 **LOAD Program Too Long** Insufficient memory remains to complete LOAD.
- 20 **Device Number Error** The device number is larger than 7 or equal to 0.
- 21 **LOAD File Error** The user attempted to load a non-load file, not a BASIC tokenized file. Tokenized files are created with the SAVE command.
- 128 **Break Abort** The user pressed the [Break] key during an I/O operation.
- 129 **IOCB* Already Open** The Input/Output Control Block is already open.
- 130 **Nonexistent Device** The user tried to access an undefined device (i.e., a device not in the handler table).
- 131 **IOCB* Write-Only Error** A READ command has been sent to a write-only device (printer).
- 132 **Invalid Command** The command is invalid for this device.
- 133 **Device or File Not Open** No OPEN command has been specified for the device.
- 134 **Bad IOCB* Number** The device number is illegal.
- 135 **IOCB* Read-Only Error** A WRITE command has been sent to a read-only device.
- 136 **EOF** The computer has reached the end of the file.
- 137 **Truncated Record** This error typically occurs when the record being read is larger than the maximum record size specified in the call to CIO. (ATARI BASIC's maximum record size is 119 bytes.)
- 138 **Device Time-Out** The device doesn't respond.
- 139 **Device NAK** Problems are located at the serial port or in the peripheral.
- 140 **Serial Bus Input Framing Error** Information was lost from the peripheral to the computer.

*IOCB refers to Input/Output Control Block. The device number is the same as the IOCB number.

- 141 **Cursor Out of Range** The cursor is out of range for a particular mode.
- 142 **Serial Bus Data Frame Overrun** Information was lost from the peripheral to the computer.
- 143 **Serial Bus Data Frame Checksum Error** Information was lost from the peripheral to the computer.
- 144 **Device Done Error** The user attempted to write on a write-protected diskette.
- 145 **Read After Write Compare Error** The user tried to open the Screen Editor with an illegal graphics mode number.
- 146 **Function Not Implemented** The function was not implemented in the handler.
- 147 **Insufficient RAM** Not enough RAM memory is left for operating the selected graphics mode.
- 160 **Drive Number Error** The user specified the wrong drive number.
- 161 **Too Many OPEN Files** No sector buffer is available.
- 162 **Disk Full** No free sectors are available.
- 163 **Unrecoverable System I/O Error** The DOS version on disk may be damaged.
- 164 **File Number Mismatch** The disk file may be damaged.
- 165 **File Name Error** The file specification has illegal characters in it.
- 166 **POINT Data Length Error** The second parameter of the POINT statement is too large.
- 167 **File Locked** The user tried to access a locked file for purposes other than to read it.
- 168 **Invalid Command** The command in a special operation code is invalid.
- 169 **Directory Full** The user has used all the open space (64 file names) allotted for the directory.
- 170 **File Not Found** The user tried to access a file that doesn't exist in the diskette directory.
- 171 **Invalid POINT** The user tried to POINT to a byte in a file not opened for update.
- 172 **Illegal Append** The user tried to use DOS II to open a DOS I file for append. DOS II cannot append to DOS I files. Using DOS II, copy the DOS I file to a DOS II diskette.
- 173 **Bad Sectors at Format Time** The disk drive found bad sectors while it was formatting a diskette. Use another diskette because a diskette with bad sectors cannot be formatted. If this error occurs with more than one diskette, the disk drive may need repair.

graphics capabilities, 50-59
graphics modes, 50
 mode 0, 51, 54
 mode 1, 53, 54
 mode 2, 53, 54
 mode 3, 54, 55
 mode 5, 54, 58
 mode 7, 54, 58

H

[Help] key, 7, 16

I

IF-THEN, 35, 37-39
increments in counting loops, 42-43
infinite loops, 23, 33, 37, 38
INPUT, 25, 26, 36, 38-39, App. B
inserting
 blank lines, 14
 blank program lines, 21
 blank spaces, 14
 program lines, 19
[Insert] key, 8, 14
installation of your computer, 3
instruction line
 limit, 11, 21
 numbering, 17, 19
INT, 34, App. B
international characters, 9
Inverse Video, 16
 to change colors in graphics
 modes, 53, 56

K

keys, descriptions of, 6-8

L

[Left Arrow] key, 8, 13, 31
line breaks, 22
line numbering, 17, 19
LIST, 17, 18
logical line, 21
loop
 counting, 40-46
 delay, 43-46
 FOR-NEXT, 40-46, 48, 50
 GOTO, 23, 28, 37-38, 48, 55
 infinite, 23, 33, 37, 38
lowercase, 12
 to change colors in graphics
 modes, 54, 56
luminance, 51, 52

M

math functions
 addition, 31
 division, 32
 multiplication, 32
 order of execution, 31-32
 subtraction, 31
math programs, 36
memory, 17, 18, 24-25

minus sign, 31, 32
Missile Command program, 3, 4
multiplication sign, 32
musical notes, 49–50, App. A

N

nested FOR-NEXT loops, 45–46
NEW, 17, App. B
NEXT, 40
 (see FOR-NEXT)
numbers, 29
numeric variables, 27, 35

O

[Option] key, 5, 16
order of mathematical functions,
31–32

P

parentheses
 for order of mathematical
 functions, 31–32
 with RND, 33
pitch, 47, 49
pixel, 55
[Play] key, 5
PLOT, 56, App. B
plus sign, 31
POKE, 9, 10, App. B
[Power] key, 3, 4, 5
PRINT, 19
 abbreviation for (?), 21
 in graphics modes, 53, 54
 to clear screen, 22
 to create blank lines, 21
 two statements on one line, 24
 with colon, 24
 with comma, 23
 with graphic symbols, 22
 with semicolon, 24
 with string variables, 26–27
PRINT #6:, 53, 54, 56
program recorder, 5

Q

question mark, 26
 abbreviation for PRINT, 21
[?] key, 31
quotation marks
 to clear screen, 22
 with PRINT, 19, 22

R

RAM, 18, 24, 25
random numbers, 32–35
READ-DATA, 50
register
 color, 51, 54, 55, 56, 57
 sound, 47
REM, 28, App. B
[Reset] key, 16, 55
RETURN (see GOSUB)
[Return] key, 5, 7, 17
[Right Arrow] key, 8, 13, 30, 31
RND, 32–35, App. B
RUN, 18, 19, App. B

S

scientific notation, 30
screen display
 format, 22
 maintaining a graphics display, 55
 stopping the LIST display, 22
[Select] key, 4, 16
semicolon, 24, 27
SETCOLOR, 51, 54, 55, 56, 57, 58, 59,
 App. B
[Shift] key, 7, 8, 12
 with [Caps] key, 8
 with [Clear] key, 13
 with [Delete Bk Sp] key, 15
 with [Insert] key, 8
 with [Right Arrow] key, 30
 with [Tab] key, 15
software
 cassettes, 5
 built-in, 3, 4
SOUND, 47–49, App. B
sound capabilities, 47–50
[Start] key, 5, 16
starting point in counting loops, 41
STEP, 42, App. B
stopping point in counting loops, 41
stopping the screen display, 22
string variables, 25, 26, 27, 37
subroutine, 50
subtraction function, 31

T

- [Tab] key, 15
 - clear tabs, 15
 - set tabs, 15
- text mode, 51–52
- text window, 53–54
- THEN (see IF-THEN)
- TRAP, 38, 45, 49, App. B

U

- [Up Arrow] key, 8, 29, 31
- uppercase, 12
 - to change colors in graphics modes, 54, 56

V

- variables, 25
 - dummy, 33
 - in SOUND commands, 48–49
 - numeric, 27, 35, 38, 41
 - string, 25, 26, 27, 37
- voice, 47
- volume, 47, 48, 49

CUSTOMER SUPPORT

Atari Corporation welcomes questions about your Atari computer products. Write to:

Atari Corporation
Customer Relations
P.O. Box 61657
Sunnyvale, CA 94088

In the United Kingdom, write to:

Atari Corp. (UK) Ltd.
Customer Relations
P.O. Box 555
Slough
Berkshire
SL2 5B7

Please write the subject of your letter on the outside of the envelope.

Atari user groups are outstanding sources of information on how to get the most from your Atari products. To receive a list of Atari user groups in your area, send a self-addressed, stamped envelope to:

Atari Corporation
User Group List
P.O. Box 61657
Sunnyvale, CA 94088
